

Scalloped tube arms

These tubes used on the control arms are double adjustable (one side has right-hand threads and the opposite end has left-hand threads). They typically adjust easily by grabbing with your hand and turning the tube to adjust length.

Sometimes they are stiff and tough to turn by hand though. In this case, we recommend using our scalloped tube wrench. (Any other tool will likely slip and mar up the surface of the tube). This wrench properly locks into the flutes to allow proper torque.

We sell this wrench on our website if you find you need it.
